

# REST API

## Description

The core of the Gigya service is a [REST](#)-like interface. Gigya offers various wraps around this API for various environments, thus in most cases you will not need to use the REST API directly.

See also [Third Party SDKs](#) for unofficial Gigya SDKs that were developed by third parties. Note that Gigya bears no responsibility for these SDKs or their usage.

## Deprecated Methods

The following methods are deprecated:

- ***socialize.disconnect*** : This method disconnects the current user from one or all of the connected providers. This method is **deprecated**, please use the [socialize.removeConnection](#) method instead.
- ***socialize.linkAccounts*** : This method replaces the Gigya UID in the user account on Gigya's DB, with a site user ID that you provide. This method is **deprecated**, please use the [socialize.setUID](#) method instead.
- ***socialize.unlinkAccounts*** : This method deletes the current user's account from Gigya's DB. This method is **deprecated**, please use the [socialize.deleteAccount](#) method instead.

**Note:** Gigya continues to support deprecated methods for backwards compatibility.

## Deprecated Response Fields

The following fields of the response object are deprecated:

- *statusCode*
- *statusReason*

The fields are still returned in the response object of the REST APIs in order to support backwards compatibility.
